TITLE: The diffractometer as an instrument which uses the diffraction phenomenon for multichannel spectral or correlation analysis of random processes

SOURCE: Vsesoyuznyy simpozium po difraktsii voln. 3rd, Tbilisi, 1964. Referaty dokladov. Moscow, 1964, 242-243

TOPIC TAGS: diffraction pattern, random process, spectrum determination, Fraunhofer line, optical information processing

ABSTRACT: Various types of optical equipment may be used for both successive and parallel analysis of the spectra and correlation functions of transparent objects. The diffractometer is one of the instruments which may be used in this manner. The spectra or correlation functions for a large number of processes can be determined simultaneously by observing the Fraunhofer diffraction pattern from individual transparent objects or combinations of objects. For instance, the spectra and correlation functions may be found for diffraction processes recorded as lines of variable density on a photographic film. In this method, the maximum number of

Card 1/2

L 51368-65

ACCESSION NR: AT5013929

simultaneously operating channels depends on the quality of the optical system and the film. In actual practice, the instrument can handle a great deal of information in a comparatively short period of time, which gives it a considerable advantage over electronic devices and even over digital computers. The instrument may also be used for signal separation and for detecting weak signals against a noisy background. The resolution and dynamic range, determined for sinusoidal signals, depend on the size of the "window" in the optical system and on the quality of the readout system. The instrument may be used as an optimum matched filter for detecting a special form of signal. In this case, the Fresnel diffraction pattern is used. "Film noises" (amplitude and phase distortions in the light wave which appear after passage through a uniformly fogged film) limit both the resolution and the dynamic range of the device.

TITLE: Sufficient conditions for the absolute stability for one  
class of systems of automatic control.

SOURCE: AN SSSR. Doklady\*, v. 157, no. 2, 1964, 299-302

TOPIC TAGS: cybernetics, control theory, automatic control, absolute  
stability, linear nonlinear link, automatic control system

ABSTRACT: A system of automatic control is considered, the structural  
model of which consists of linear and nonlinear links connected by  
such a closed chain of interactions that if  $x$  and  $y$ , respectively,  
are the input and output coordinates of the nonlinear link, the  $y$   
and  $x$  are respectively, the input and output coordinates of the  
linear link. The investigation of the absolute stability, and the  
derivation of the sufficient conditions for the latter, are essential  
steps in computing these systems. By using V.M. Popov's method (see  
M.A. Aizerman and F.R. Gantmakhor, "Absolute Stability of Control  
Systems, Moscow 1963), a theorem is proven for the absolute stability

TITLE: Dynamics of the simplest servosystem with backlash

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Radiofizika.  
v.5, no.4, 1962, 751-765

TEXT: The article studies the simplest model of servomechanism with backlash and derivative control under the following assumptions: 1) the moment of inertia of the load on the output shaft is zero, and the load has no reaction on the shaft of the prime mover; 2) there is sufficient dry friction on the output shaft to stop it as soon as the driving moment is removed. The analysis is carried out for constant signal (stability analysis) and variable input signal (precision for typical input signals), by means of point transformations in the parameter plane. For piecewise-linear or quadratic signals it is found that a parameter choice is always possible for the system to remain stable with bounded input signal. There are 6 figures. ✓B

TITLE: Absolute stability of a class of controlled systems

SOURCE: IVUZ. Radiofizika, v. 8, no. 3, 1965, 605-614

TOPIC TAGS: control system stability, automatic control

ABSTRACT: Recently, the theory of stability of controlled systems has been confronted with the following problem: Given a class of control systems depending on several parameters, one must find the domain of values of those parameters which secure an absolute stability of the class. Earlier other authors investigated the stability of control systems whose structural model consisted of a linear and nonlinear loop coupled by a closed interaction loop (A. I. LUR'YE, V. N. POSTNIKOV, PMM /Prikladnaya matematika i mekhanika - Applied Mathematics and Mechanics/, 8, 246, 1944) and of systems with identical linear parts (M. A. AYZERMAN, Avtomatika i telemekhanika /Automation and Telemechanics/, 7, 148, 1946). Using a method which is analogous to POPOV's approach (see, e.g., M. A. AYZERMAN, F. T. GANTMAKER, Absolyutnaya ustoychivost' reguliruyemykh sistem /Absolute stability of control systems/, AN SSSR, M., 1962), the present paper solves the problem of the absolute stability of an essentially new class of

Card 1/2

L 30971-66

ACC NR: AP6018119

controlled systems. A single such class can contain systems with different dimensionality of the associated phase space; the absolute stability determination is also slightly modified to agree with the specific features of the new class under consideration. Orig. art. has: 1 figure and 40 formulas. [JPRS] O

AUTHOR: Bruska, Otakar (Brzhuska, Otakar); Matyas, Miroslav  
(Matiash, Miroslav); Mazanec, Karel (Mazanets, Karel)

TITLE: Contribution to the study of steel properties at high  
deformation rates

SOURCE: Kovove materialy, no. 3, 1964, 309-321

TOPIC TAGS: dynamic hardness, high deformation rate, Armco iron  
dynamic hardness, 30KhN2MA steel dynamic hardness, room temperature  
dynamic hardness, subzero temperature dynamic hardness, explosive  
forming, high energy rate forming

ABSTRACT: Armco iron and 30KhN2MA steel were subjected to dynamic  
hardness tests with the purpose of studying their behavior at high  
deformation rates. The method is based on shooting a projectile  
into a specimen. The dynamic hardness  $H_K$  is determined as the ratio  
 $E:w$ , where  $E$  is the energy consumed in the formation of the impression  
having a volume  $w$ . The dynamic hardness tester consists of four  
parts: 1) a device for projectile acceleration, 2) a device for

Card

1/3

ACCESSION NR: AP4041522

measuring projectile velocity, 3) a device for determination of ballistic pendulum deflection, and 4) a device for measuring the volume of the impression. A projectile 4-5 g in weight shot with a velocity of approximately 130 msec<sup>-1</sup> and a kinetic energy of approximately 5 kg m hits a specimen placed in a ballistic pendulum. The deflection of the latter determines the consumed energy. The velocity of the projectile is determined by computer and two photo cells. The dynamic hardness ( $H_K$ ) of Armco iron at +20, -30, -78, and -196°C amounts to 180, -200, -235, and -210  $H_K$ , i.e.,  $H_K$  has its maximum at -78°C. The dynamic hardness of 30KhN2MA steel depends on heat treatment and has its maximum at -30°C. The fact that  $H_K$  at first increases and then decreases is explained by the adiabatic character of the deformation process and the change of the value of specific heat. The cause of the different behavior of both tested materials has not yet been reliably explained. The dynamic hardness measurements, however, provided valuable findings on the mechanical properties of the materials at high deformation rates. These findings will make possible a more detailed determination of the conditions for shaping by unconventional methods, e.g., by explosive forming. Orig. art. has: 8 figures, 6 formulas, and 1 table.

TITLE: On the Tissue Interrelations in the Parasite-host System in  
the Ontogeny of Opisthorchis Felineus (O tkanevykh vzaimo-  
otnosheniyakh v sisteme parazit-khozyain v ontogeneze sibirskoy  
dvuustki)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 2, pp 454-455  
(USSR)

ABSTRACT: The trematoda ontogeny consists of a series of unequal elements. One may refer to these as phases of the life cycle. Thus several trematoda in the parasite phase in a mollusk may pass over from the stage of the mother sporocyst into the stage of the daughter sporocyst, then into the Redia stage, and finally into the Cercaria stage. The trematode which is in a certain ontogeny stage can pass over from one phase (from a parasite phase into a nonparasite one) into another one (Ref 1). Sporocysts, Redia, and Cercaria form biological stimuli in the organism of the intermediate host and cause a certain response reaction above all in the inner tissues of the place where the parasite is. The trematode mentioned in the title lives for one year in the mollusk Bithynia leachii. It is character-

Card 1/3

SOV/20-126-2-63/64

of *Opisthorchis Felineus*

istic of the tissue reaction of the mollusk that it is bound to be a protective reaction and useful for the mollusks themselves; the survival of the parasite larvae is, however, to a certain extent secured. Otherwise this species would not exist any more. The smallest most recent sporocysts were striking among the numerous stages of the parasite found by the authors. They were surrounded by a layer of basophilic amoebocytes. The latter are little differentiated elements of the connective tissue of the mollusk (Ref 3). In earlier development stages they are fused to a coencytic symplast which expresses the defensive function of the internal tissue of the mollusk (Ref 3). Young sporocysts can simply divide into 2 or more parts (Fig 1; 1) and form a complex. Around this complex a common connective tissue capsule is formed. The symplast expands with the growth of the sporocysts. Its protoplasm becomes thin, and the cores lie in one layer. New basophilic amoebocytes settle at such places. The symplast cores are capable of amitotic separation. The protoplasm mass is gradually reduced and decomposes into fibers. Individual fibers then contain the cores (Figs 1, 2). The mentioned capsule

Card 2/3

On the Tissue Interrelations in the Parasite-host System in the Ontogeny  
of *Opisthorchis Felineus*

forms a defensive reaction of the interior of the mollusk against the introduction of the stimulus. The thin loose-fibrous capsule does, however, not inhibit the penetration of the trophic products into the parasite larvae. Figure 2 shows a capsule. Then there follow vast lacunae filled with tissue fluid. A solid envelope is formed only when the parasite perishes. This specific defensive reaction was worked out in the course of the evolution. A solid envelope would have killed the parasite and extinguished the species and furthermore blocked the exit of the Cercaria. There are 2 figures and 3 Soviet references.

SOV/20-127-6-48/51

TITLE: Histochemical Investigation of Glycogen in *Opisthorchis felineus*

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 6, pp 1315-1316  
(USSR)

ABSTRACT: The author intends to investigate the interchange of substance in the worm *Opisthorchis felineus* (Rivolta, 1884) in order to find chemical and physical methods for taking a direct action against it. The trematoda have been poorly investigated in this respect (Refs 2,3). All investigators assert that the endoparasitic worms have an anoxobiotical respiration. This is due to a complete, or almost complete, oxygen deficiency in individual intestinal sections, in the liver-gall and in the bladder-gall (Ref 4). Therefore, these worms have a large stock of glycogen, because under these conditions neither fats nor proteins can be utilized as energy-supplying material (Refs 5,6). Data by N. A. Golubeva (Ref 7) are quite contradictory to this. She found no glycogen in the active organs of the worm under consideration, and therefore asserts that this trematode is aerobic. She considers the blood of the final host a possible oxygen source. In view of these facts, the author studied histochemical-

Card 1/3

SOV/20-127-6-48/51

**Histochemical Investigation of Glycogen in *Opisthorchis felineus***

ly the accumulation and distribution of glycogen in the tissues of the worm mentioned (A. L. Shabash, Ref 8). Figure 1 shows the total picture of the glycogen distribution in the body of *Opisthorchis felineus*. It shows that the glycogen mainly accumulates in the parenchyma. Here it lies between the slings of the uterus, along the intestine and the canal of the excretorial system around the genital glands. Glycogen has the shape of large grains and lumps of different forms, and it lies extracellularly (Fig 2) (as in Ref 11). A large quantity of glycogen is found in the yolk cells. Egg cells in all stages do not contain any glycogen; it is also missing in the ovary (Figs 1:b,4). Nearly no glycogen can be found in the testicles (Figs 1:h,2). But ripe spermatozoids contain some glycogen (Figs 1:b,3). There is much glycogen in the sucker, particularly in the abdominal one (Figs 3:1), but here the granulae are smaller than in the parenchyma. There is little glycogen in the skin-muscle hose; it is almost completely missing in the intestinal and uterine walls. These results make it possible for the author not to agree with the data found by Golubeva (Ref 7). There are 3 figures and 11 references, 8 of which are

TITLE:

Amplifiers for Electromagnetic Relays (Usiliteli dlya elektro-magnitnykh reley)

SOV/107-58-10-23/55

PERIODICAL:

Radio, 1958, Nr 10, pp 18-21 (USSR)

ABSTRACT:

The author discusses the working of electronic relays in which the valve acts as an amplifier; he remarks that there is, however, another group of noncontact electronic relays containing trigger devices with one or two stable states. He says that electronic relays can be divided up into the following groups according to their circuit characteristics: 1) circuits fed by direct or alternating current at a commercial frequency; 2) according to the means of supply of the control voltage (the signal) - circuits with grid contact, taking their initial negative bias from the grid of the valve, and circuits operated by an external signal source, for example a pick-up or a preamplifier; 3) according to the method of switching on the load - circuits with switching on of the grid into the anode (cathode) circuit of the valve, and bridge-balanced circuits. The author describes these types of relay in detail, and says that they can be used for

TITLE: The photoelectric fluorometer  $\Phi M-1$  (FM-1)

PERIODICAL: Zavodskaya laboratoriya, v. 27, no. 9, 1961, 1151-1156

✓

TEXT: A measuring device for the quantitative analysis of fluorescent vitamins, ferments, dyes, etc. is described. The minimum measurable concentration is 0.002  $\gamma/ml$  for vitamin  $B_2$ , 0.001  $\gamma/ml$  for quinine, and 0.01  $\gamma/ml$  for thallium (as rhodamine complex in benzene). The volume of the bulbs is 3 ml only, the volume of the solution to be measured is 1.5 ml. The 1.5 mm thick walls of the bulbs are made of nonfluorescent glass of the type K-8 (K-8). A  $\Delta PC-50$  (DRS-50) mercury quartz lamp of the Moskovskiy elektrolampovyy zavod (Moscow Electric Lamp Factory) serves as a UV light source. The quartz tube of the lamp is located in a flask of uviol glass which transmits rays up to 2400 Å and is provided with the standard lamp socket P27 (R27). The diameter of the ultraviolet light beam is 3 mm only.  $\mathbb{Y}\Phi C1$  (UFS1) are used as primary light filters for the range 2400-4000 Å,  $\mathbb{Y}\Phi C2$  (UFS2) for 2700-3800 Å, and  $\mathbb{Y}\Phi C3$  (UFS3) for 3200-3900 Å. The

Card 1/4

The photoelectric fluorometer...

S/032/61/027/009/011/019  
B101/B110

fluorescence can be passed through 16 secondary interference filters having a band-pass width of 20  $\mu\text{m}$  each for the range 380-680  $\mu\text{m}$ . The box of the apparatus contains 5 bulbs, thus permitting serial measurements. The photoelectric circuit is a highly sensitive photometer based on the modulation of the photomultiplier current with double mains frequency (100 cps). Fig. 2 shows the scheme of the apparatus. Since some secondary filters are permeable to ultraviolet and violet, the resulting disturbances are avoided by a corresponding arrangement of light exposure and receiver, and by inserting filters of  $\lambda\text{C-4}$  ( $\text{ZhS-4}$ ) or  $\lambda\text{C-8}$  ( $\text{BS-8}$ ) glass impervious to light with wavelengths shorter than 380-400  $\mu\text{m}$ . The apparatus has a lever for zero adjustment thus filling the bulb with pure solvent. The photoelectric multiplier  $\Phi\text{3Y-20}$  ( $\text{FEU-20}$ ) of the Moscow Electric Lamp Factory has, at 900 v, a sensitivity of 2.5-3 a/lm; at amperages  $> 0.1 \mu\text{a}$ , however, the measurement becomes inaccurate. Since the curve  $I = f(C)$  ( $I$  - intensity of fluorescence,  $C$  - concentration of fluorescent substance) is not linear, a calibration curve has to be recorded (Fig. 4). The apparatus is connected to the mains by means of a ferroresonance voltage stabilizer. Late in 1962, the production of  $\text{FM-1}$  is to be started at the Frunzenskiy zavod "Fizpribor" (Frunze "Fizpribor" Plant). The present
